

# Git in Computer Science Department

1 April 2016

# Git Basics

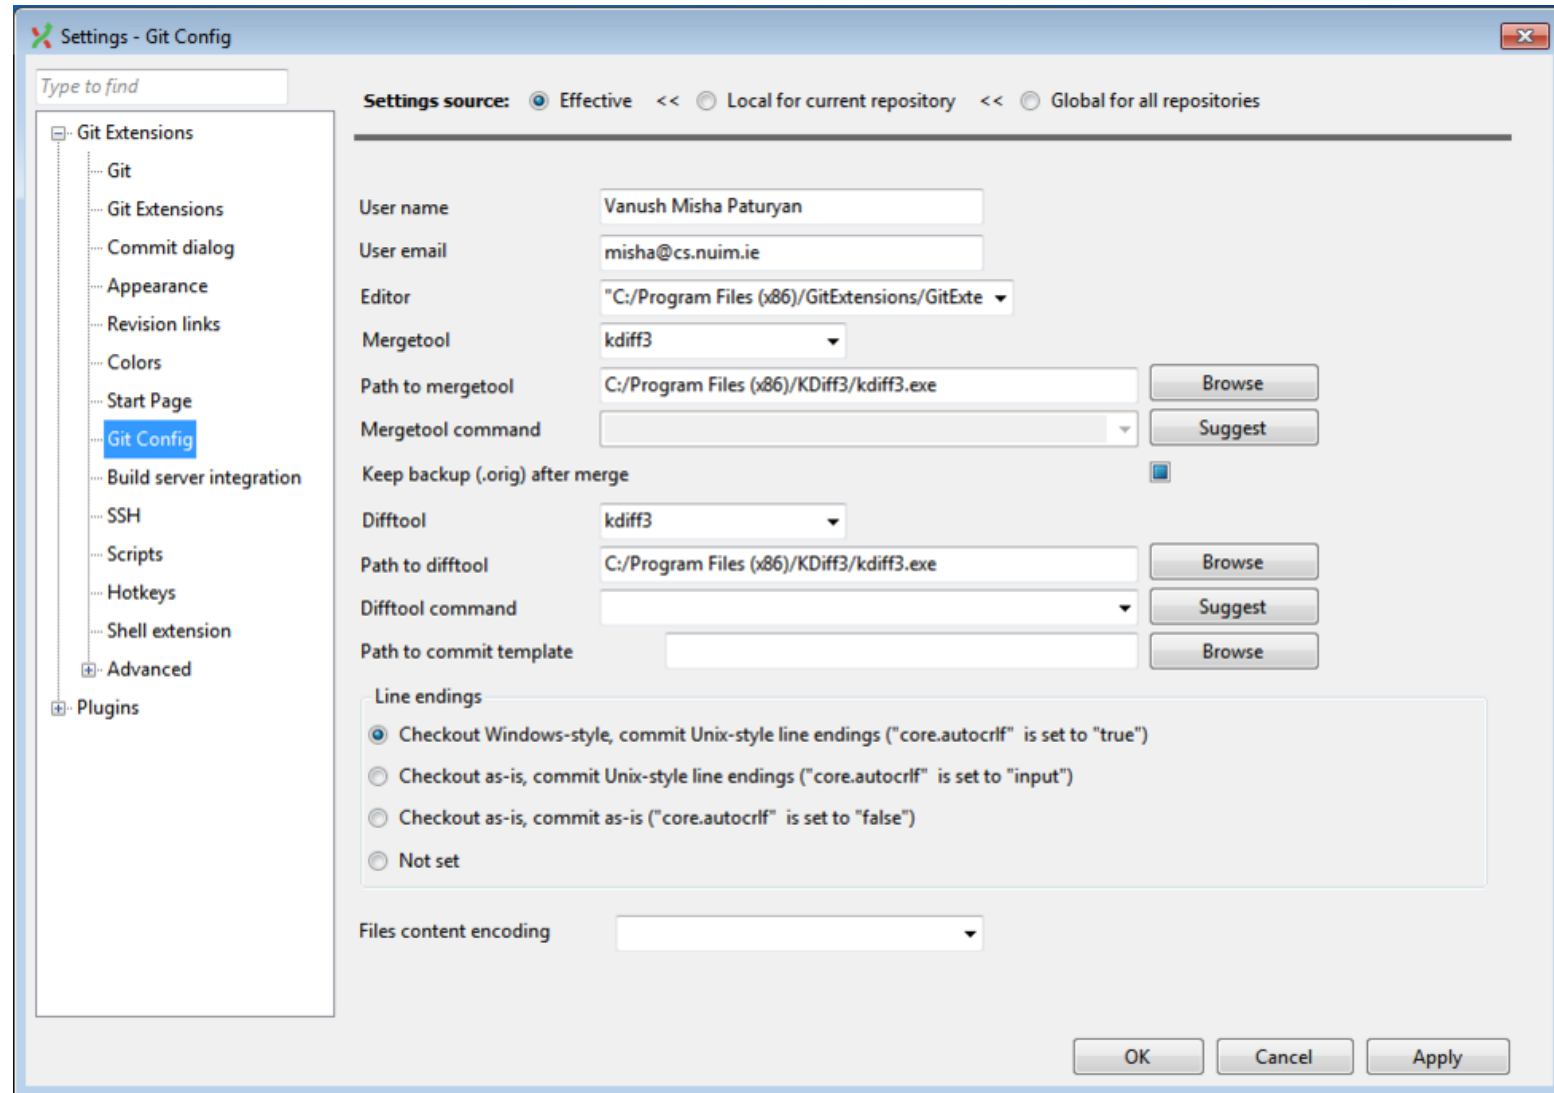

Picture taken from <https://git-scm.com/book/en/v2/>

# Windows: Installing Git Extensions

- <https://github.com/gitextensions/gitextensions/releases>
- GitExtensions-2.48.05-SetupComplete.msi also available from J: drive
- Make sure to install MsysGit
- Make sure to install KDiff
- Choose OpenSSH as SSH Client
- Sometimes KDiff's installer stays under Git Extensions' window: bring it up and accept license agreement etc
- MsysGit asks about adjusting PATH: leave setting as default "Use Git Bash only"

# Git Extensions: Initial Setup

- Run Git Extensions
- Click on "Tools -> Settings"
- Click on Git config
- Put your name in "User name"
- Put your email in "User email"

# Windows: password-less login

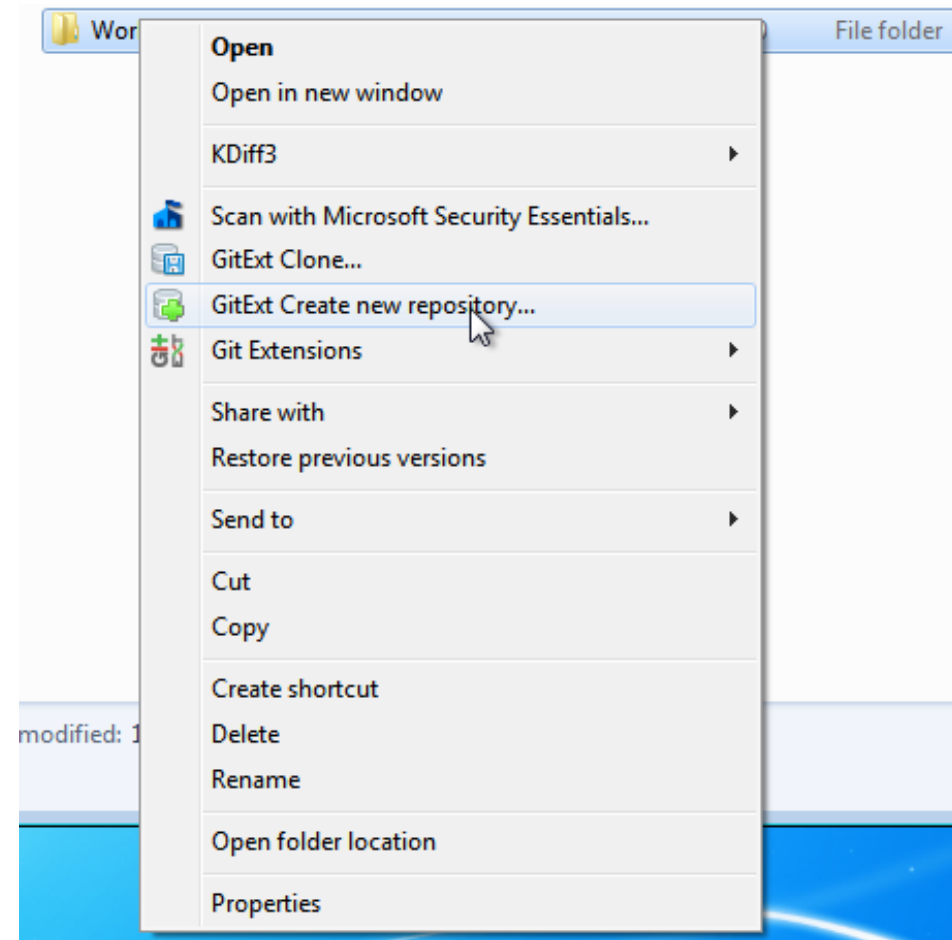

- Click on "Tools-> Git Bash" in Git Extensions (A "cmd.exe" window should open)
- Type **ssh-keygen**
- Accept default values to all questions (by pressing Enter)
- Type **scp ~/.ssh/id\_rsa.pub <login>@git.cs.nuim.ie:**
- (replace <login> with your login)
- (enter your password)
- Double-check that there were no errors!

# Windows: password-less login (cont.)

- Connect to the server and put the public key in its proper place:
- In the shell: type **ssh <login>@git.cs.nuim.ie**
- (and enter your password again)
- Your prompt should change, it should say "<login>@git:~\$"
- Type **mkdir -p .ssh**
- Type **cat id\_rsa.pub >> .ssh/authorized\_keys**
- Exit from server by typing "exit"
- Connect to the server again (this time it should not ask for the password)

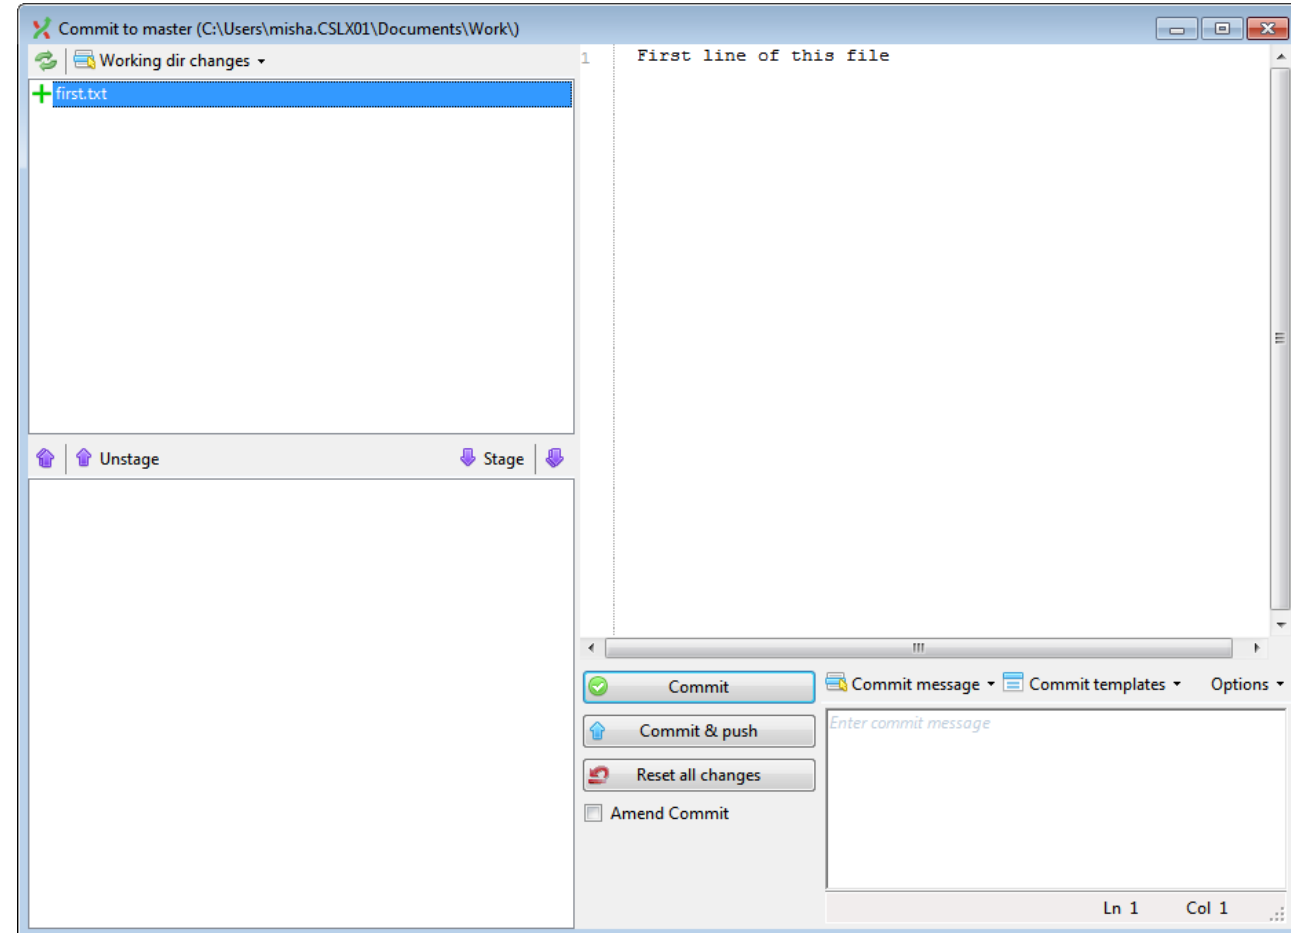

# First local repository

- Assumption: you have all your work in a folder named "Work".
- In the Windows Explorer, navigate to "Work", right-click and choose "GitExt Create new repository"
- (the Git shell command is "git init")

# Adding files and committing

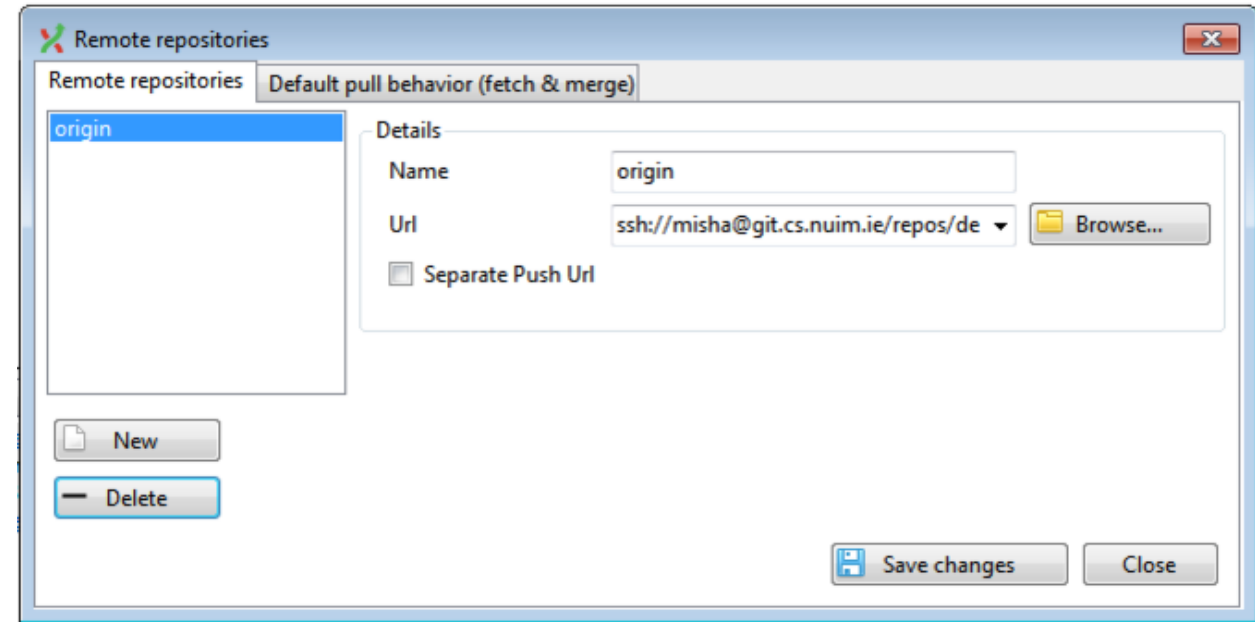

- Right-click on the folder and choose "GitExt Browse"
- Click on "Commit" button to commit some files.
- Pick files from the top that you want to put into repository and stage them (CLI: `git add`)
- When all files you want to be part of one commit are staged enter the comment and Commit them (CLI: `git commit`)

# Remote repositories

- In GitExtensions: click on "Repository -> Remote Repositories"
- Click on "New", give it name "origin", and add Url in the form: `ssh://<login>@git.cs.nuim.ie/repos/2016/desem/<login>`
- (replace <login> with actual login)
- (CLI: `git remote add origin <url>`)

# Remote: pull before you push

- Make sure to pull from the remote before pushing to it!
